Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the Lotal score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  US-09-823-649A-3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           gene (mutTaq) (sequence given in AAQ80746) having normal 5' nuclear activity but less than 1% of the wt Taq DNAP activity. mutTaq was cut from pTTQ18 by EcoRI-SalI digestion and cloned into pET-3c. Thus clone was digested with BstXI and BamHI. The DNA was treated with DNAPbcl Klenow fragment and dNTPs, blunt-ended and religated, resulting in an in-frame deletion of 903 nucleotides. The DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The Tag DNA-polymerase (DNAP) gene was amplified by PCR. Amplified fragments were ligated into pTTQ18 vector, which contains the hybrid trp-lac (tac) promoter. An amplification/selection protocol was used to isolate clone 4B containing a mutated Tag DNAP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              5' Nuclease(s) derived from thermostable DNA polymerase(s) - have cleavage activity with reduced synthetic ability, used for detection of specific target sequences.

                                                                                                                                                                                                                                   genes were created from that construct. This mutant was created after the vector was digested with BstXI and BamHI. The DNA was then treated with the Klenow fragment of DNAPEC1 to trim both 3' overhangs to blunt ends which were then ligated together, resulting in an in frame deletion of 903 nucleotides. The resulting mutant
                                                                                                                                                                                                                                                                                                                        The method may also be used for the identification of viruses, especially hepatitis C virus and simian immunodeficiency virus. Thermus aquaticus (Taq) DNA polymerase was amplified using two primers (AAT27679, AAT27680). The Taq polymerase DNA was inserted into the BamHI restriction site of the expression vector pET-3c and mutant genes were created from that construct. This mutant was created
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  alternatively, microbial genc sequences. Cleavage products ar compared to the cleavage products of reference gene sequences, method is used for detecting mutation in the rman p33 gene; f

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     5'-3' nuclease activity may facilitate higher sensitivity allelic discrimination in a combined polymerase ligase chain reaction (PLCR) assay. An enhanced amt. of 5'-3' exonuclease activity may be desirable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polymerases are useful in many recombinant DNA techniques, esp. nucleic acid amplification by PCR, self-sustained sequence replication (SSR) and high temp. DNA sequencing. The absence of the control of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence is that of Thermus species sps17 polymerase DNA which has been mutated. The mutation designated pSPSd2-151 causes the polymerase enzyme produced to exhibit a different amt. of 5'-3' exonuclease activity than the native enzyme. Thermostable DNA
Mutant thermostable DNA polymerase pspsd2-73.

                                                                                                                                                                                                                                                                                                                                                                                                                                            Best Local Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Alignment Scores:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polymerases are useful in many recombinant DNA techniques, esp. nucleic acid amplification by PCR, self-sustained sequence replication (SSR) and high temp. DNA sequencing. The absence of 5'-3' nuclease activity may facilitate higher sensitivity allelic discrimination in a combined polymerase ligase chain reaction (PLCR) assay. An enhanced amt. of 5'-3' exonuclease activity may be desirable
                                                                                                                                                                                                         1810 CTCTCCCAGGAGCTCTCCATCCCCTACGAGGAG 1842
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           detection of a target nucleic acid sequence. Mutation of the DNA encoding particular regions of the enzymes can be used to prepare a range of recombinant proteins having 5'-3' exonuclease activity to a complete lack of activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence is that of Thermus species sps17 polymerase DNA which has been mutated. The mutation designated pSPSd2-73 causes the polymerase enzyme produced to exhibit a different amt. of 5'-3' exonuclease activity than the native enzyme. Thermostable DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Thermostable DNA polymerases with altered 5'-3' exo nuclease activity - having conserved regions mutated or deleted, for use in e.g. PCR, sequencing and detection assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         old_sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           has been mutated. The mutation designated pSPSdA288 causes the polymerase enzyme produced to exhibit a different amt. of 5 - 3 exonuclease activity than the native enzyme. Thermostable DNA polymerases are useful in many recombinant DNA techniques, esp.
                                                                                                                                                   AAQ24009 standard; DNA; 1899 BP
                                                                                                                                                                                                                                                                                                                                                                               Sequence 1635 BP; 267 A; 572 C; 559 G; 237 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                discrimination in a combined polymerase ligase chain reaction (PLCR) assay. An enhanced amt. of 5'-3' exonuclease activity may be desirable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         nucleic acid amplification by PCR, self-sustained sequence replication (SSR) and high temp. DNA sequencing. The absence of 5'-3' nuclease activity may facilitate higher sensitivity allelic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 11; Page 59; 185pp; English.

                                                                                                                                                                                                                                                                                1432 CTCTCCCAGGAGCTCTCCATCCCCTACGAGGAG 1464
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                detection of a target nucleic acid sequence. Mutation of the DNA encoding particular regions of the enzymes can be used to prepare a range of recombinant proteins having 5'-3' exonuclease activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nucleic acid amplification by PCR, self-sustained sequence replication (SSR) and high temp. DNA sequencing. The absence of 5'-3' nuclease activity may facilitate higher sensitivity allelic discrimination in a combined polymerase ligase chain reaction (PLCR) assay. An enhanced amt. of 5'-3' exonuclease activity may be desirable in enzymes used in homogeneous assays for the amplification and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence is that of Thermus species sps17 polymerase DNA which has been mutated. The mutation designated psp82d-199 causes the polymerase enzyme produced to exhibit a different amt. of 5'-3' exonuclease activity than the native enzyme. Thermostable DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               old_sequence
Mutant thermostable DNA polymerase pSPSd2~151.
                                                                                                                                                                     AAQ24008 standard; DNA; 2043 BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1899 BP; 320 A; 647 C; 647 G; 285 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             See also AAQ23993-Q24013, AAQ24320-36 and AAQ24343-60.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  polymerases are useful in many recombinant DNA techniques, esp.

The methods are used for the specific detection of nucleic acid sequences, via a cleavage-based procedure, but without the need for amplification of target sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         have nuclease, but not polymerase activity are preferably used due to their specificity. The cleavage product specifically formed is detected, preferably by the use of radioactively labelled oligonucleotides. These

5' Nuclease(s) derived from thermostable DNA polymerase(s) - cleavage activity with reduced synthetic ability, used for detection of specific target sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Local Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence encodes the thermostable polymerase of Thermus species sps17. It may be mutated to encode an Asp residue at position 43 instead of the wild type Gly residue. This substitution is shown to result in a 100 fold decrease in the 5'-3' exonuclease activity with no change to the polymerase activity of the enzyme.
                                                                                                                                                                                                                                                                                                                                                                                      3316 CTCTCCCAGGAGCTCTCCATCCCCTACGAGGAG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The Taq DNA-polymerase (DNAP) gene was amplified by PCR. Amplified fragments were ligated into pTTQ18 vector, which contains the hybrid trp-lac (tac) promoter. An amplification/selection protocol was used to isolate clone 4B containing a mutated Taq DNAP gene (mutTaq) (sequence given in AAQ80746) having mormal 5' nuclease activity but less than 18 of the wt Taq DNAP activity. mutTaq was cut from pTTQ18 by EcoRI-SalI digestion and cloned into pET-3c. Thus Clone was digested with Bs(XI and Bam:I. The DNA was treated with DNAPBCI Klenow fragment and GNTPS, blut-ended and religated, resulting in an in-frame deletion of 903 nucleotides. The DNA
                                                                                                                                                                                                                                                                                                                                               30-AUG-1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Escherichia, Mycobacterium, Salmoenla, Shigella and Staphylococcus. Escherichia, Mycobacterium, Salmoenla, Shigella and Staphylococcus. The method may also be used for the identification of viruses, especially hepatitis C virus and simian immunodeficiency virus. Thermus aquaticus (Taq) DNA polymerase was amplified using two primers (AAT27679, AAT27680). The Taq polymerase DNA was inserted into the BamHI restriction site of the expression vector pET-3c and mutant genes were created from that construct. This mutant was created after the vector was digested with BstXI and BamHI. The DNA was then treated with the Klenow fragment of DNAPEcl to trim both 3' overhangs to blunt ends which were then ligated together, resulting in an in frame deletion of 903 nucleotides. The resulting mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cleavage of nucleic acids using an enzyme, especially a nuclease selected from the group consisting of Cleavase (RYM) But enzyme, Thermus aquaticus DNA polymerase, "Hormus thermophilus DNA polymerase, Escherichia coli ExoIII and the Saccharomyces cerevisiae

The 3' overhang of BstXi was trimmed to a blunt end, while the 5' overhang of BsmH! was filled in. The blunt ends were ligated together. This resulted in an in-frame deletion of 903 nucleotides. The enzyme encoded by the present protein is also referred to as Cleavase BB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence, clone 4F encodes a Tag DNA polymerase enzyme that has normal 5' nuclease activity, but reduced synthetic ability. This sequence was derived from the mulTag construct described in AAT70343. The entire mutTag gene was cut from the plasmid, and cloned into pET-3c. This clone was digested with BstXI and BamHI, at unique
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Thermostable 5' nuclease derived from thermostable polymerase - has

cc cleavase BB, comprises an cc altered Thermus aquaticus DNA polymerase (Taq) gene in which cure concleotides 875-1778 of the wild-type gene coding sequence are cd deleted. Mutant gene mutTaq (see AAT76643) was used as the starting cm material for the construct. Cleavase BB is a thermostable ct structure-specific nuclease preferred for use in nucleic acid cleavage methods of the invention. Mutant genes (AAT7644-47) cc were constructed in order to determine which portions of the Taq cc were constructed in order to determine which portions of the Taq cc were constructed in order to determine which portions of the Taq cc characterisation of nucleic acid (NA) sequences and variations in cc characterisation of nucleic acid (NA) sequences and variations in the target sequence and cleaving the NA cleavage structure on cc site-specific manner. The 5' nuclease activity of various enzymes cc structure, thereby indicating the presence of specific NA sequences or specific variations of them.
